STUDY GUIDE

for the doctoral (PhD) studies in third cycle of Veterinary Medicine on the Faculty of Veterinary Medicine - Skopje
1. INTRODUCTION

In order to comply with the new Law of Higher Education (Official Gazette no. 35/2008 and no. 103/2008) and implementing the recommendations of the Bologna Declaration, Teaching and Scientific council of the Faculty of Veterinary Medicine Skopje (FVMS) decided to implement a program for doctoral studies of third cycle in the field of veterinary medicine for obtaining the title of Ph.D.

The study program is implemented within the School of Doctoral Studies at the University "Ss. Cyril and Methodius". Given that this program is no longer organized by specializations in which the mobility of students was hampered or limited, students will get significantly greater mobility in selecting subjects for the content of which they will be interested and in tune with the theme of their doctoral thesis.

New doctoral studies provide designing curriculum depending on the specifics of the theme of the candidate, the current research activities of the institution, as well as the future professional engagement of the candidate. The study program will be organized as a program for PhDs in order to educate researchers showing greater interest in science as a profession, and for researchers who want to connect veterinary science with practice by which they will acquire academic qualifications for work in certain veterinary subspecialties.

Besides the "internal mobility" these doctoral studies are an opportunity for mobility to other, related programs and faculties within the university. At the European veterinary faculties is emphasizes the need for adoption of joint programs for doctoral studies (Baljer, G. et al., Journal of Veterinary Medical Education 31 (3), 239-241, 2004). As a result of the previously mentioned need for cooperation, in future perspectives are opened for cooperation in joint doctoral programs with the veterinary faculties in Europe (joint study programme).

New doctoral studies are an integral part of the new model for building a career which gives a better perspective for the future researchers on their individual development and an opportunity for bigger choice in the early stage of their professional career. Upon successful completion, young scientists will gain the ability for independent research in multidisciplinary teams from many areas of biotechnology and medical sciences.

The program of the proposed doctoral course will develop in line with the existing scientific potential of the faculty, students expressed interest and the need of the employers, with accurately described competencies and skills that doctoral candidates will possess after the end of the course. The content of the subjects will be constantly updating and if necessary each will be coordinated in order to avoid overlap with contents of undergraduate courses. Teaching will be based as much as possible on the practical work of students in acquiring the relevant and latest scientific knowledge. From the start of their doctoral course students should join the work of scientific projects and continuously monitor the scientific literature in order to develop their own critical stance toward their own results and ideas. Besides that the students, if necessary will be allowed study visit in the appropriate foreign scientific institutions in order to master the specific techniques and skills.

Innovativeness of the program lies in a completely new approach that allows maximum creativity of the student who in collaboration with the mentor will shape their own study program based on the offered subjects. Also this program allows greater freedom and initiative of the student to devote to learning of those contents which will be in tune with the theme of their thesis or, in general, with their scientific interest. As a result, students will be established as top experts in conducting scientific processes in a particular scientific discipline. The involvement of scientists from other scientific institutions in realization of the program will allow development of cooperation in solving the given scientific problems.
2. GENERAL PART

- **Realized by:** University “St. Cyril and Methodius” - Faculty of Veterinary medicine - Skopje
- **Study program:** Doctor of Science (in veterinary medicine) third cycle of studies
- **Duration of studies:** three years (6 semesters)

The conditions and enrolment at the studies are in accordance with the Higher Education Act, the Rules for doctoral studies, as well with the detail specific criteria published in the announcement by the University, St. Cyril and Methodius” in Skopje.

The basic requirements for entering the study program of the third cycle:

1. Diploma/Certificate:
   - for completed integrated first and second cycle i.e. completed second cycle of studies in Bologna in the field of veterinary medicine, medical sciences, natural sciences and biotechnological sciences, or
   - for Master of Science in the old curriculum of the above indicated areas or
   - for acquired 300-360 credits from related studies of regulated professions, or
   - for title of specialist in adequate specialization

2. Spoken English (Certificate of Faculty of Philology "Blazhe Koneski" or an international certificate such as TOEFL, FCE, CAE)\(^1\).

Criteria for ranking the candidates:
- The success gained at the previous integrated cycle i.e. previous two cycles
- Published publications
- Participation in national and international research projects
- Study visit abroad
- Knowledge of other languages
- Interview
- Motivation letter
- Recommendations and other specific criteria

\(^1\)If a student obtained the education of the previous two cycles in English as proof of knowledge of English will be considered the diploma for completed second cycle or integrated first and second cycle of studies.
3. STUDY PROGRAM STRUCTURE

**Scientific field:**
Biotechnical sciences

**Scientific sub-field:**
Veterinary medicine

**Scientific disciplines:**
- Anatomy of animals
- Biophysics
- Embryology
- Physiology
- Histology
- Immunology
- Microbiology
- Molecular biology
- Pathology
- Pathophysiology
- Diseases in ruminants
- Diseases in non-ruminants
- Diseases of poultry
- Diseases of fish, bees and game
- Pharmacology and toxicology
- Parasitological diseases
- Infectious diseases
- Radiobiology
- Surgery
- Ophthalmology
- Orthopedics
- Radiology and physical therapy
- Andrology and artificial insemination
- Gynecology, obstetrics and sterilization
- Therapy and health protection of animals
- Endocrinology and biotechnology of reproduction
- Zoohygiene
- Hygiene and technology of products and raw materials of animal origin
- Health protection of animals in aspect of environment protection
- Nutrition - dietetics
- Veterinary legislative
- Forensic veterinary medicine
- History and ethics, deontology in veterinary medicine

Study program of the third cycle of studies (or doctoral studies) at the Faculty of veterinary medicine in Skopje, is organized in accordance with the Law on Higher Education of the Republic of Macedonia and the Rules for the third cycle of studies at UKIM as three year study program, which contains total of 180 ECTS credits in which each credit corresponds to 30 hours of total working engagement.

The total number of credits (180) are acquired in several fields i.e. integral parts of the third cycle (doctoral) studies:

- Training for research = 30 ECTS:
  - Three compulsory courses for gaining generic knowledge = 12 ECTS, and
Doctoral seminars, conferences and workshops for research practice = 18 ECTS

- Education consisted of ten courses from the sub-field and area of research = 30 ECTS, and
- Registration, preparation and presentation of the doctoral dissertation = 120 ECTS

Teaching of the courses will be carried out in Macedonian and / or English depending on the linguistic homogeneity or heterogeneity of the students. The doctoral thesis will be written in Macedonian and / or English language. Presentation of doctoral thesis will be in public, in Macedonian or English.

The structure of the study program for doctoral studies (the distribution of credits and liabilities of the subjects per semester) is shown in Table 1.

**Table 1: STRUCTURE OF THE STUDY PROGRAM FOR DOCTORAL STUDIES (the distribution of credits by courses and liabilities by semesters)**

**LIST OF COURSES**

I). Courses for general generic knowledge organized by the School of Doctoral Studies:

1. Ethics (4 ECTS points)
2. Use of animals in scientific and research purposes (4 ECTS points)
3. Methods of clinical research and verification of laboratory results (4 ECTS points)

II). Elective courses from the sub-field and area of research:

1. 
2. 
3. 
4. 
5. selected by the candidate together with his/her mentor
6. offered in Appendix 1. Every course takes 3 ECTS points.
7. 
8. 
9. 
10. Respective programs, with a brief description of the contents are given in Appendix 1.

**4. EXPLANATION FOR REALIZATION OF THE STUDY PROGRAM**

The study program for the most part will be realized at the FVMS. Some of the contents of a program, if necessary, will be performed at other institutions of the country and abroad with which the faculty has or will establish research collaboration.

FVMS is housed in 5 buildings with a total area of 3660 m², with the administrative part, 3 lecture rooms (50, 40 and 30 seats, respectively), an computer classroom, library and...
12 laboratories (Table 2). The faculty has equipment worth around 2 million Euros (Table 2). Within the faculty operate three institutes, 20 departments, 1 clinic and 4 centres. The Food Institute has 6 departments (Department for Food Safety and Veterinary Public Health; Department for domestic animals feed; Department of Chemistry; Department of Pharmacology and Toxicology, Department of Economics with Management and Department for Administrative Veterinary), 5 laboratories (laboratory of microbiology of food and feed; laboratory for determination the quality of food and feed; laboratory for residues and contaminants; laboratory for determination the quality of raw milk and laboratory of Pharmacology and Toxicology) and 2 centres (Centre for adverse events and information for veterinary drugs and educational centre for food safety and veterinary public health). The veterinary Institute has 9 departments (Department of health of farmed animals; Department of biology and pathology of fish, bees and game, Department of diagnostic imaging; Department of veterinary surgery, Department of microbiology and parasitology, Department of pathology and forensic medicine, Department of pathophysiology and Department of animal hygiene and protection of animal environment), 5 laboratories (laboratory of bacteriology, laboratory of virology, laboratory for serology and molecular diagnostics, laboratory of parasitology and parasitic diseases and laboratory for TSE), X-ray room and a clinic (clinic for pet animals). The Institute of Biomedicine and reproduction has 5 departments (Department of Biochemistry and cell biology; Department of radiobiology, Department of Functional Morphology, Department of animal husbandry and Department of reproduction) and 2 centres: centre for artificial insemination (with 2 laboratories: laboratory for production, cryopreservation and control of domestic animals semen, and laboratory for assisted reproduction) and centre for animal welfare.

37 permanent employees (19 teachers and 18 assistants, Table 3) are hired in the teaching and research activities at the Faculty and 67 people for technical and administrative support. The teaching staff of the Faculty for Natural Sciences and Mathematics, University “Ss. Cyril and Methodius” also takes part in the teaching. The faculty has a ramified network of international cooperation with many universities and institutes abroad.

Place for realization of the study program: Faculty of Veterinary Medicine, Lazar Pop Trajkov 5-7, 1000 Skopje, and if necessary other units of the University and Institutions with which the Faculty/University cooperates in teaching and research activity

Number of students enrolled per year: 25

Space and equipment: 5 buildings with a total area of 3660 m², 3 lecture room (50, 40 and 30 seats, respectively), an computer classroom, library, 15 laboratories, a clinic and an X-ray cabinet with the following equipment:

**Purpose and objectives of the course program**

This course elaborates the 3-R concept for protection of animals during their use in science research purposes, and practical examples for complete implementation of the 3-R concept. The 3-R concept is crucial for improvement of science and for animal welfare, and is important for ethical and legal reasons, as a fundamental principle of human experimental procedure. This course gives definition of 3-R and obtains guides and directions for using these principles in practice.

**Contents of the course program**

- **Theory classes.** 3-R concept: Replacement – using of methods with avoiding or replacing the use of animals in cases when is it possible; Reduction – minimisation of number of animals used in experiment – for example with improvement of the experimental design and statistical analysis used in the research; Modification, alternative (refinement) – improvement of the experimental procedures and other factors with impact on animals, as accommodation and care for decreasing their suffering, torturing and improvement of welfare during rest of their lives.

- **Practicals.** Within this course the Council Directive 86/609/EEC of 24 November 1986 on the approximation of laws, regulations and administrative provisions of the Member States regarding the protection of animals used for experimental and other scientific purposes is elaborated. This directive includes the principles of ethical evaluation of the projects; approving of projects, promotion of alternative views in science research work; accommodation and use of animals in science research work; classification of cruelty towards animals, their reusing and their accommodation and nursing. According the Animal Welfare Law this directive implementation of this directive is legal obligation within process of design and realization of the science researching. Teaching includes also information for directions for nursing and accommodation of laboratory animals, including the minimal conditions for accommodation of different animal species, and euthanasia procedures regulated by the Animal Welfare Law. Course also includes explanation of principles of design of science researching project, its justification from aspect of evaluation of injury (of animals) and the benefit of the project, demonstration of manual for obtaining licence for use of animals in different science researching or testings, as well as the work of the ethic committees.

**Organization**

- 60 hours theory classes and practicals
- 60 hours other forms of activity

**Teaching methods**

- Theory classes and practicals: interactive
- Written assay: learning with use of referent literature and internet, making of written assay; oral presentation and discussion of the written assay.

**Specific recommendations related with teaching**

**Scoring of the student’s activities:**

### Purpose and objectives of the course program

The main aim of the subject is to acquaint the students with the biochemical structure and organization of the nervous system.

### Contents of the course program

Blood-brain barrier, cerebrospinal fluid, function and circulation; the neuron and its biochemistry; brain biochemical content; synapses, synaptogenesis, myelination, synaptic function, biochemistry of brain development; biochemical mechanisms of nervous signals, channels, pumps and transporters; neurotransmitters and synaptic transmission, neurotransmitter receptors and their molecular aspects.

### Organization

30 hours theory classes and practicals
60 hours other forms of activity

### Specific recommendations related with teaching

### Purpose and objectives of the course program

In this course students will gain knowledge in understanding the mechanisms of cell biology at the molecular level and regulation of these mechanisms.

### Contents of the course program

The course covers several aspects of molecular cell biology, particularly the mechanism apoptosis / necrosis; kinase / phosphatase classification and regulation; factors of transcription, classification and regulation; flow of information in gene expression, regulation of cell growth, cohesion of cells and tissues - cytoskeleton; extracellular metrics, lipid mediators, regulation and function; DNA repair mechanisms.

### Organization

30 hours theory classes and practicals
60 hours other forms of activity

### Teaching methods

Theory classes and practicals: interactive
Written assay: learning with use of referent literature and internet, making of written assay; oral presentation and discussion of the written assay.

### Course Information

**Course Code**: FVMS DS07

**Year of study**: I

**Semester**: winter or summer

**Total teaching lessons**: 90

**Realized by**
- prof. Vlatko Ilieski, PhD
- ass. prof. Lazo Pendovski, PhD

**Purpose and objectives of the course program**

Theoretical and practical teaching of the course is aimed to introduce the students with anatomic features of animal organism with clinical relevance. During the practical classes will be used radiograms on which the anatomy of living animals will be studied comparatively.

**Contents of the course program**

The course includes the clinical anatomy of head and neck, clinical anatomy of front and rear limbs, and clinical anatomy of thorax, abdomen and pelvic cavity. Students will learn to identify bones and external bone features on the live animal, to identify the attachments of each muscle, surgical approach to the cavities of the head, neck structures, organs and other anatomical structures in the thoracic and abdominal cavity and limbs, knowledge of the names and positions of the openings that are associated with the cranial nerves, identification of the direction of movement and distribution of surface nerves and blood vessels of head, neck, body and limbs.

**Organization**

30 hours theory classes and practicals

60 hours other forms of activity

**Teaching methods**

Theory classes and practicals: interactive

as. prof. Lazo Pendovski, PhD  
as. prof. Florina Popovska-Perchinik, PhD |
| Purpose and objectives of the course program | PhD students will gain knowledge about basic principles of dyeing methods in immunohistochemistry, the application of various chemicals used in preparation of histological, immunohistochemical and histoenzimatic slices. |
| Contents of the course program | Basic functioning mechanisms of various types of microscopes (light, fluorescence, confocal, electronic). Students will learn about technical problems during the process of tissue preparation and about morphometrical methods in macroscopic and microscopic analysis. Detailed procedures used in quality evaluation of meat product and other tissues and organic systems will be taught as well. |
| Organization | 30 hours theory classes and practicals  
60 hours other forms of activity |
| Teaching methods | Theory classes and practicals: interactive  
Written assay: learning with use of referent literature and internet, making of written assay; oral presentation and discussion of the written assay. |

Purpose and objectives of the course program

Students on PhD studies will gain knowledge of parasitic diagnostics methods with which parasitic diseases are diagnosed and determination of parasites and their development forms.

Contents of the course program

**Theory classes.** methods of feces examinations, parasitological methods of examining: skin, respiratory organs, digestive system, nerve system, blood and biopsy materials, histopathological examinations, parasite DNA detection.

**Practicals.** Direct faeces smear, qualitative coprological examinations, flotation of eggs and cysts, sedimentation, Baerman concentration, cultivation of larvae (Volkenburg and Sullivan method) micrometry, quantitative coprological examinations, (McMasters method), Waidy method, interpretation, identification of helminthes eggs, identification of cysts and oocysts, histopathological analysis, identification of microfilariae, trichinoscopical examinations (compression method and method of artificial digestion) molecular diagnostics with PCR and real-time PCR

Organization

30 hours theory classes and practicals
60 hours other forms of activity

Teaching methods

Theory classes and practicals: interactive

### Course

**Course Name:** Apiculture and health protection of bees

**Code:** FVMS DS11

**Year of Study:** I

**Semester:** Winter or summer

**Total Teaching Lessons:** 90

**Realized by:** prof. Misho Hristovski, PhD

### Purpose and Objectives of the Course Program

The aim of this course is introducing students with scientific and practical aspects of biological characteristics of bees, intensive production and diagnosis of bee’s diseases and implementation of preventive measures, control, medication and eradication of bee’s diseases.

### Contents of the Course Program

- Meaning of apiculture, Taxonomy and types and of bees, Members of the bee family, Biological characteristics of the honey bee, Starting the apiculture, Beehives, tools and equipment for apiculture, Apiculture technology, Honey giving plants, Bee products, Health protection of bees

### Organization

- **30 hours theory classes and practicals**
- **60 hours other forms of activity**

### Teaching Methods

- Theory classes and practicals: interactive
- Written asssay: learning with use of referent literature and internet, making of written asssay; oral presentation and discussion of the written asssay.

**Purpose and objectives of the course program**

The aim of this course is to introduce the PhD students with most important parasitic disease affecting the wildlife.

**Contents of the course program**

**Theory classes.** Epidemiology, zoonoses, parasite diseases, risk factors of parasite diseases appearance, wild and domestic animals contacts, cohabitation of wild and domestic animals, (migration, nomadic way of livestock farming, Protostomatic diseases: Coccidiosis, Piroplasmosis, Sarcocystosis, Toxoplasmosis, Histomoniasis. Diseases caused by helminthes, diseases caused by arthropods, Parasitological diagnostics in wild animals, basic monitoring, prevention and therapy of parasite diseases in wild animals.

**Practicals.** Processing and preparation of diagnostic material; marking, listing and interpreting diagnostic materials. Parasitical mapping; Identification of helminthes, protozoa and arthropods. Coprological tests and egg identification, the influence of parasite diseases on general health condition of wild animals, serological and molecular diagnostics methods, interpretation of the monitoring results, gathering and sampling of feces, recognizing of epidemiological situation in wild animals resorts (natural and intensive). Coprological monitoring in the field (how to gather material in the right places before and after the shooting ) therapy based on the monitoring, group therapy, therapy by using more antihelminths simultaneously, individual therapy, disinfection, deratization in farming of wild animals.

### General Information

**Course:** Diagnostic methods of poultry diseases  
**Code:** FVMS DS16  
**ECTS:** 3.0

- **Year of study:** I  
- **Semester:** winter or summer  
- **Total teaching lessons:** 90  
- **Realized by:** prof. Metodija Dodovski, PhD

### Purpose and Objectives
Advanced introduction and application of certain parasitological, bacteriological, mycological, virological, serological and molecular diagnostic methods.

### Contents of the Course Program
- **Theory classes and practicals.** Isolation and identification of some important bacterial and fungal pathogens in poultry, isolation of virus on embryonated eggs, hemagglutination, hemagglutination inhibition, ELISA, conventional PCR, real-time PCR.

### Organization
- 30 hours theory classes and practicals  
- 60 hours other forms of activity

### Teaching Methods
- Theory classes and practicals: interactive

Course
Physiological basis of veterinary clinical pharmacology
Code          FVMS DS19
Year of study 1
Semester      winter or summer
Total teaching lessons 90
Realized by prof. Romel Velev, PhD

Purpose and objectives of the course program
Purpose of this course is to introduce students with structure, mode of action and pharmacokinetics of individual groups of veterinary drugs in certain species; scientific basis for their safe and efficient use of ethical, environmental implications and implications on human health from the use of veterinary drugs in veterinary practice.

Contents of the course program
Theory classes and practicals. Structure, acting mechanism and pharmacokinetics of drugs acting on digestive system and metabolism; fluids and electrolytes; drugs acting on heart and circulation; antibiotics and chemotherapeutics; anti-inflammatory drugs; hypnotics, sedatives and anesthetics; anthelmintics and ectoparasitics; sexual hormones; dermatological drugs; ophthalmic drugs; analgesics etc. Rational application of drugs. Problems with antibiotic resistance. Ecological and human health implications with usage of the veterinary drugs. Veterinary drugs residues and causes for their presence in animal products (milk, meat, honey, contamination trajectories, farmaco-toxicological meaning, metabolism, diagnostics, carence, MRL, legal regulations). Detection of antibiotics in environment.

Organization
30 hours theory classes and practicals
60 hours other forms of activity

Teaching methods
Theory classes and practicals: interactive
Written assay: learning with use of referent literature and internet, making of written assay; oral presentation and discussion of the written assay.

**Purpose and objectives of the course program**

The goal of this course is to introduce the student with the main principles of veterinary toxicology.

**Contents of the course program**

Structure, mode of action and pharmacokinetics of toxic substances, pathogenesis, clinical diagnosis and treatment of poisoned animals, ethical, environmental implications and implications on human health from potential use of toxic substances; evaluation of products of animal origin contaminated with toxins etc.

**Organization**

30 hours theory classes and practicals
60 hours other forms of activity

**Teaching methods**

Theory classes and practicals: interactive
Written assay: learning with use of referent literature and internet, making of written assay; oral presentation and discussion of the written assay.

**Purpose and objectives of the course program**

The purpose of this course is learning the basics, theory and practical application of methods and principles of application and pharmacological methods for measuring parameters (cardiovascular, respiratory, etc.). Dealing with experimental animals after administration of drugs; pharmacochemical methods of measuring the concentrations of drugs and endogenous substances in tissues and body fluids and understanding and specific work on the problem of clinical trials of drugs (drafting, plan and randomization of clinical pharmacological research, data processing and types of clinical trials of drugs).

**Course**: Diagnostics and therapy of infertility in domestic animals | **ECTS**: 3.0

**Code**: FVMS DS24

**Year of study**: I

**Semester**: winter or summer

**Total teaching lessons**: 90

**Realized by**: prof. Toni Dovenski, PhD

### Purpose and objectives of the course program

The aim of this course is to familiarize students with the latest discoveries in animal infertility such as ovarian cycling problems, ovulation disturbances, cystic formation in ovaries, and infectious, alimentary and immunological etiology of infertility. Students are supposed to understand the etiology, pathogenesis, diagnostics, prognosis, therapy and prevention of these reproductive abnormalities.

### Contents of the course program

- Anatomical, functional and breeding etiological factors in animal infertility;
- Influence of nutrition, infectious, parasitic and metabolic factors in animal infertility;
- Influence of animal breeding programs and farm management in animal infertility;
- Inflammation processes in uterus, oviducts and ovaries as factor for animal infertility;
- Puerperal disorders as factor for animal infertility (in mammals);
- Basic principles of ultrasonographic examination of the reproductive tract as a modern diagnostic method for reproductive disorders;
- Modern approach in the treatment and prevention of reproductive disorders;
- Using of hormonal and other treatment methods.

### Organization

- 30 hours theory classes and practicals
- 60 hours other forms of activity

### Teaching methods

- Theory classes and practicals: interactive
- Written assay: learning with use of referent literature and internet, making of written essay: oral presentation and discussion of the written essay.

### Purpose and objectives of the course program
Determining the aims and systemic strategies, managing the data logs, organizing farm visitation protocols, familiarizing with the epidemiological and economical aspects in HHM. Familiarizing with the principles of monitoring and managing during the dry period; Dairy production and metabolic disorders; Reproductive performance in diary animals; Udder performance; Feet disorders; Control of infectious diseases.

### Contents of the course program
Basic principles, aims and systemic strategies in herd health management of farm animals for milk and meat production (farm visitation protocol, data logging, epidemiological and economic aspects of HHM); Monitoring of herd reproduction: Calf management, determining and execution of protocols; Determining the aims; Optimization of milk production: principles and methods in optimizing digestion in fore stomachs, managing metabolic disorders related with rumen; aim determination, realization and monitoring; Dry period monitoring: Strategies before and during the dry period; physiological changes, disorders and prevention during the dry period. Udder health management: determining the aims; pathophysiology, epidemiology and types of infection. Executing a protocol. Analysis, solutions, treatment and monitoring. Monitoring of the reproductive performances: defining aims for optimization of reproductive performances; Reproductive parameters; Executing, concluding and monitoring. Feet health monitoring: defining aims and executing monitoring protocols; Analysis, decisions, treatments and monitoring. Control of infectious diseases: Monitoring and control of common infectious diseases such as BVDV, IBR/IPV, BRSV, PRRS, leptospirosis, paratuberculosis, salmonellosis, brucellosis, leucosis, etc.

### Purpose and objectives of the course program
The aim of this course is advanced level studying of the normal functions of the cell, organs, and body systems. Physiology studies normal processes in animal body and its relations with the outside environment. The students will learn some laboratory and biochemical procedures that are used for monitoring the normal functions of the body which are correlated with the animal welfare in the breeding programs.

### Contents of the course program

#### Theory classes
Animal physiology PhD studies course offers the student to choose one of the following chapters: The molecular and cellular basis of physiological regulation; Neurophysiology; Cardiovascular physiology; Gastrointestinal physiology and metabolism; Endocrinology; Animal reproduction physiology and lactation; Renal physiology; Respiratory functions; Homeostasis, and the immune system. By choosing one or more of these chapters, students are able to concentrate on particular area of animal physiology which would be relevant to their idea of the further scientific arrangements.

#### Practicals
This part of the course offers the PhD students to be familiarized with certain laboratory procedures and examinations that will help them to monitor and examine the normal bodily functions. These laboratory methods include: hematology, biochemistry, endocrinology, urology, neurology, cardiology and pulmology.

### Organization
30 hours theory classes and practicals

## Purpose and objectives of the course program

The course should allow enhancement of theoretical and practical knowledge required for understanding the etiology and pathogenesis and mastering the surgical techniques during trauma, emergency and elective situations, including oncological interventions in companion animals.

## Contents of the course program

**Theory classes and practicals.** Surgery approach to the nasal meatuses, surgery approach to the larynx, diaphragmatic hernia, pneumothorax, surgery approach to the lower parts of respiratory tract, diseases of the teeth and oral cavity, diseases of oropharynx, diseases of oesophagus, gastrotomy, gastric dilatative volvulus, piloric stenosis, enterotomy, surgical treatment of colic in horse, perianal fistula, rectal prolapse, perineal hernia, surgical operations of the liver, spleen, pancreas, renal, urethral and bladder calculi, cystotomies, urethrotomy/stomy, nephrotomy, ovariotomy/hysterectomy, Caesarean section, pyometra, uterine torsion, prolapse of vagina and uterus, neoplasms, puerperal...
Injuries of perineum, vestibuloplastics, mammary gland, prostate, penis and preputium, phymosis and paraphymosis.

### Organization

### Course

**Surgical techniques in production animals** | **3.0 ECTS**

### Code
FVMS DS31

### Year of study
I

### Semester
winter or summer

### Total teaching lessons
90

### Realized by
prof. Plamen Trojachanec, PhD

### Purpose and objectives of the course program
The course should allow enhancement of the theoretical and practical knowledge on the situation analysis at the individual or on a herd level, including the production diseases that require surgical intervention, deepening the techniques for performing certain surgical procedures on productive animals, including the diseases of the acropodium and elaboration of preventive measures.
### Contents of the course program

### Organization

- 30 hours theory classes and practicals
- 60 hours other forms of activity

### Teaching methods

- Theory classes and practicals: interactive
- Written assay: learning with use of referent literature and internet, making of written assay; oral presentation and discussion of the written assay.

<tr>
<td><strong>Purpose and objectives of the course program</strong></td>
<td>With this course the PhD students would be more in detail introduced with veterinary general radiology and physical therapy. General radiology obtains all information about formation and physical features of the X rays, their application in medicine in general, radiation sources and formation of radiogram. Clinical radiology is very important part of veterinary medicine and deals with various issues of pathological disorders in the organs and organic systems in domestic animals. Physical therapy (physiotherapy) is medical discipline where the therapy uses natural factors (light, water, air, electricity etc.) and it is based of scientific knowledge from physics, chemistry, electrotechnics, electronic, biology and medicine. The part of the course dealing with physical therapy is separated in general and special part. General part concerns fundamentals of the physical therapy, theoretic basis of physiotherapy, mechanism of therapy effect of the physical techniques, biophysical basis of the physical medicine and organization in and of physical therapy departments itself. The special part is divided on physical therapy and physical diagnostics. Physical therapy includes electrotherapy, phototherapy, hydrotherapy, thermotherapy, pelotherapy, kerytherapy, masotherapy and ultrasonotherapy. Physical diagnostics includes electrodiagnostics, ultrasonodiagnostics, thermography and biotelemetry.</td>

<td></td>
</tr>
</tbody>
</table>

**Purpose and objectives of the course program:**
The course will provide students with broad practical and theoretical knowledge of modern intensive way of growing small and large ruminants. The course will enable the establishment of a system for control of the farm animals herd.
health, with special methods for diagnosis of metabolic diseases of organic and inorganic nature. In this way it will be determined how farm animals are satisfied with their breeding system, so that any error in diet regime will result in metabolic profile disorders. If the metabolic profile is primary problem in the herd, it results in huge economic losses, so certain adjustments in diet and breeding can be made. The course includes the basics of hematological and biochemical analysis including acid-base balance, ruminal content and urinalysis.

**Contents of the course program**

- **Theory classes and practicals.** Basics of the production diseases. Puerperal paresis. Downer cow syndrome. Hypomagnesaemic tetany. Hypomagnesaemic tetany in calves. Ketosis in ruminants (bovine acetonemia; pregnancy toxemia in sheep). Fatty infiltration of the liver in cattle (fat cow syndrome, pregnancy toxemia in cattle). Diseases caused by nutritional deficits: a deficit of energy and protein; deficits minerals (cobalt, copper, iodine, iron, sodium chloride, zinc, manganese, potassium, selenium and/or vitamin E), nutritional deficiency of calcium, phosphorus and vitamin D and imbalance in the relationship calcium/phosphorus, vitamin deficiencies (vitamin A, vitamin K, hydrosoluble vitamins). Diseases caused by congenital defects. Weight loss or inability to weight gain.

**Organization**

- 30 hours theory classes and practicals
- 60 hours other forms of activity

**Purpose and objectives of the course program**

The course is designed for the student to acquire knowledge of the clinical and laboratory diagnostic methods used to control the health status of small and large ruminants. Diseases that occur in small and large ruminants are infectious diseases of viral and bacterial etiology, prion diseases of the CNS, metabolic disorders of organic and inorganic nature and all diseases classified by organic systems. The subject is covering: etiopathogenesis, clinical finding, clinical and...
laboratory diagnosis, treatment and prophylaxis of ruminants. The course covers the specifics of the mentioned investigation and interpretation of results. The course includes the basics of serological and molecular diagnostics, as well as hematological, biochemical and urinalysis.

Contents of the course program

**Theory classes and practicals.** Differential diagnosis with laboratory findings: anemia, antithrombin III, APTT, bilirubin, urea, creatinine, enzymes, eosinophilia, fibrin degradation products (FDP), hypercalcemia, hyperchloremia, hyperfibrinogenemia, hyperglicemia, hyperglycemia, hyperkalaemia, hypernatremia, hyperphosphatemia, hiperproteinemia, hypocalcemia, hypochloremia, hypoglycemia, hypokalaemia, hypomagnesaemia, hypolactulinaemia, hyponatremia, hypoproteinemia, hypothyroidism, metabolic acidosis, metabolic alkalosis, monocytosis, neutropenia, neutrophilia, packed cell volume, prothrombin time, respiratory acidosi, respiratory alkalosis, thrombocytopenia. Disturbances in nutritional imbalances: cardiovascular, skin, gastrointestinal, hematopoietic, hepatic, musculoskeletal, neurological, reproductive and respiratory.

Purpose and objectives of the course program

Aim of this course is to introduce the students to the role of veterinary profession in food safety and veterinary public health. Students are taught food microbiology, food poisoning, food spoilage as well as European and national food legislation. Risk analysis and process control in food production with contemporary control systems. Role and duties of the official veterinarian in the control of spreading the diseases, hygiene of animals for slaughter, food processing and handling are explained. Longitudinal and integrated approach to the safe food production, animal welfare and influence of food to human health. Within the practicals the students would be trained to perform the duties of the
official veterinarians. It includes all the official forms and documents used by the official veterinarians, sampling, packing and sending the samples to the official laboratory. Students would be taught how to collect samples for the official monitoring programs for Salmonella, residues and contaminants in food of animal origin. Methods for testing of food and water microbiology are also included in this course.

### Contents of the course program

**Theory classes and practicals.** Basis of food microbiology, foodborne poisonings, spoilage of food, European and national legislative concerning this issue. Risk analysis, process control in food production, contemporary control systems. Role and tasks of the official veterinarian in control of diseases with obligate reporting, hygiene of slaughtering animals, food processing and manipulation related with food safety. Longitudinal and integral approach on safe food production in aspect of animal welfare, hygiene, food safety and impact of food on human health.

### Purpose and objectives of the course program

The purpose of the course is that the students are gained with thorough theoretical and practical knowledge of food microbiology. The lectures include a review of the fundamentals of food microbiology, the metabolism of the microorganisms, the mechanisms of their growth, reproduction and extinction and the factors which influence them. Students will be acquainted in details with the types of microorganisms and their characteristics and the hazards they pose to the human health. In the practical classes students will be introduced with the routine and advanced methods for the detection of the microorganisms as well with the rapid and automatic methods in food microbiology.

### Contents of the course program

**Theory classes and practicals.** Fundamentals of ecology and epidemiology.
**Course Program**

Microorganisms present in the stream of food chain. Microbiology of food, feed and drinking water. Control of the microorganisms present on the working surfaces and in environment in object aimed for food production, processing and trading. Ubiquitary microorganisms in food, their useful role and application in process of preservation and modification of food of animal or plant origin. Techniques of microbiological testings, microorganism identification, sampling procedures. Food poisoning: alimentary infections and intoxications, microorganisms which cause diseases and their resources, distribution along the food chain, and their control.

**Purpose and objectives of the course program**

The purpose of this course is to introduce the students the contemporary methods of the molecular diagnostic and genetical researches which are used for identification and genetic typisation of the microorganisms which are potential food poisoners.

**Contents of the course program**

**Theory classes and practicals.** Typisation of the bacterial isolates: Phenotypic methods (serotyping, phagetyping, antimicrobial resistance) and Genotypic methods (gel electrophoresis, methods based on sequences). Introducing of the various methods of molecular typisation such as: ribotyping, multilocus enzymatic electrophoresis, RAPD (Random Amplification of Polymorphic DNA), PFGE (Pulsed Field Gel Electrophoresis), PCR technique. Essentials of the epidemiology of the food poisoning. Classification of the food poisoning. Types of analytical studies: group study and control case study.

**Organization**

30 hours theory classes and practicals  
60 hours other forms of activity
Teaching methods
Theory classes and practicals: interactive
Written assay: learning with use of referent literature and internet, making of written assay; oral presentation and discussion of the written assay.

Specific recommendations related with teaching

### Purpose and objectives of the course program

Detail introducing with laboratory tests related with hematopoietic system and blood elements, biochemical parameters in the plasma and serum, as well as urine samples.

### Contents of the course program

**Theory classes.** I. Hematology: red blood cells, platelets and clotting factors, white blood cells. II. Changes in serum: introduction, plasma proteins, electrolytes, minerals, nitrogen substances, carbohydrate, bilirubin and lipid metabolism, clinical enzymatology - plasma enzymes in diagnostics, diagnostic endocrinology, other body fluids. III. System examination: examination based on certain organs, diagnostic profiling and pattern recognition.

**Practicals.** Practical laboratory medicine: sampling and using of external laboratory; side-room testing in veterinary practice; “home laboratory.”

### Organization

30 hours theory classes and practicals
60 hours other forms of activity

Purpose and objectives of the course program

The aim of this course is to study pathogenesis of tumors (cancerogenesis), their etiology, taxonomy, as well as characteristics of the benign and malignant tumors. Having regard of clinical importance of the tumors, special attention would be given on tumor clinical characteristics, the laboratory diagnostics (pathohistological and cytological) and treatment of the tumors. With application of the most recent classification of tumors, this course includes tumors of all organic systems, with special attention on skin tumors and tumors of mammary gland.

**Purpose and objectives of the course program**

In the graduated studies only the basic principles of farm animal nutrition is studied. So, this course gives detailed study of the diet of the certain types and categories of farm animals requires detailed knowledge of the principles of their diet. This is especially applied to the basic nutritional and effective components and the needs of animals depending of the age, stages and technology of production. For this reason the course cover details of the aforementioned parameters. The program includes details of the pathology of nutrition which can be an issue with certain type of feed used in farm animals diet.

**Contents of the course program**

Theory classes and practicals. Specifities in nutrition in certain species and categories of farm animals. Main nutritive and beneficial compounds in animal according the age and production stages and technologies. Pathological aspects of nutrition with certain types of feeds used in farm animals nutrition. Antinutritive substances with biological origin (mycotoxins), and with physical-chemical origin (pesticides, herbicides, etc.). Impact of antinutritive substances on health and productive status in farm animals.

### Purpose and objectives of the course program
PhD students are going to get the most recent information about the nutritional needs in pet animals. It refers to pets needs in different pathological conditions.

### Contents of the course program

#### Theory classes
Disciplines and scientific studies that apply the basic nutrition methods in domestic animals, are applied recently, primary in clinical nutritional aspect, based on scientific information. Themes that are going to be learned will help students to understand the basic nutritional principles for certain pathological conditions, method of application and duration of the specific diet. The material in this subject refers to interpretation of the basic principles of clinical nutrition, which will be done over consultations; respectively students will be introduced to the nutritional needs for different diseases of the organs. Metabolic needs in patients with different diseases are connected to the psychic condition of the patient and special nutritional needs.

#### Practicals
Following the diet in hospitalized patients, preparation of appropriate nutritious meals and adequate food application in different patients. Monitoring the diet in these patients is going to be conducted through rotation of the patients with: gastrointestinal disorders, endocrinology disorders, cardiovascular, hepatobiliary and renal disorders. The clinical rotation will finish with monitoring food allergies in pets.

### Organization
30 hours theory classes and practicals
60 hours other forms of activity

### Teaching methods

ass. prof. Goran Nikolovski, PhD

### Purpose and objectives of the course program
PhD students would be introduced with the endocrinology changes and changes in the exocrine pancreas. The appearance of metastatic changes of the pancreas and their diagnosis are a part of the topics in this subject. It refers primarily to the needs of the pets in different pathology situations.

### Contents of the course program
Theory classes. Changes of the exocrine pancreas, clinical manifestation and
course program

Diagnostics of these conditions are part of the education. Endocrine changes of the pancreas: diabetes mellitus, insulinoma, hypoglycemic syndrome are the most common disorders. The advantage of introducing the endocrinology disorders of pancreas is adequate application of diagnostic and therapeutic protocols.

Metastatic changes of pancreas, laboratory diagnosis and ultrasound and other imaging techniques. Therapy protocols at metastatic disorders.

Practicals. Monitoring patients with acute pancreatitis, therapy and special diet for these patients. Patients with diabetes mellitus - glucose tolerance test, following the curve of glucose in blood, determining optimal insulin dose. Patients with insulinoma, laboratory and therapy protocols. Special diet of patients with insulinoma. Patients with hypoglycemic syndrome, diagnostic and therapy. Observation of patients with pancreatic tumors, chemotherapy.

Realized by
prof. Blagica Sekovska, PhD

Purpose and objectives of the course program
In this course the PhD students would be introduced with whole process of vertical integration within production from-field-to-fork process, which is one of the main recommendations of the European Union. Traceability of supply chains is principle precondition for introducing the food safety concept, as well as for implementation of total quality control. These type of knowledge would be necessary for those who would work anywhere within the production chain, or in control of food products, especially those from animal origin. Also, within this course the place and role of the consumers would be elaborated. This course would elaborate briefly definition and types of animal products supply chains, transport and logistics, types of distribution, making decisions about the supply chains, their organization, control and economic aspects. Finally, this course would include quality management, total quality management, as well as the place and role of the consumers in the from-field-to-fork process.

### Purpose and objectives of the course program

The so-called soft skills are nowadays recognized as necessity for successful development of the veterinary profession. So, this course offers to the students and integrative approach to basic marketing and management principles viewed and applied on micro level - the level of veterinary practice. The course includes service design process, managing models and development of human resources, main principles of communication with clients, meaning of image of veterinary practice in aspect of client attraction, making proper business plan and managing the veterinary practice.

**Purpose and objectives of the course program**

Communication with clients today is one of the most important issues for the future development of the veterinary profession. This course would obtain to the students basic knowledge about the principles of business communication, clients' suspects and how these suspects to be satisfied, definition of communication channels, basic principles of public relations, basic principles of ethics in business relationships, models of successful negotiations and contracting as well as communication rules in service activities. The course would be helpful for students for improving development of the veterinary practice, but also in other business relationships.

### Purpose and Objectives of the Course Program

The topic of this course is role of the veterinary profession and veterinary company in the process of animal health protection via introduction with veterinary service supply and demand models, consumers’ behavior, factors of service development, production theories from aspect of costs and benefit (cost and benefit theory), economical efficiency, analysis of making decisions process during the actions of the veterinarian, the impact of veterinary service in development of husbandry, organization of production in aspect of animal health control.

### Contents of the Course Program

**Practicals.** Making written assay, mini (problem solving) projects on predicated topic, debates, discussions, visit of veterinary ambulances.

### Organization

- 30 hours theory classes and practicals
- 60 hours other forms of activity

### Teaching Methods

2. Tim E. Carpenter: Zdravlje životinja i ekonomika proizvodnje
3. Blagica Sekovska: authorised lectures
Purpose and objectives of the course program

The aim of this course is to acquaint PhD students with profound knowledge of monitoring the residues and contaminants in food. They will meet with European and domestic legal framework related to the presence of these substances in food, and control their use and penal provisions in case of exceeding the statutory provisions.

Course Chemistry and analysis of food | 3.0 ECTS
Code FVMS DS58
Year of study I
Semester winter or summer
Total teaching lessons 90
Realized by prof. Zehra Hajrula-Musliu, PhD

Purpose and objectives of the course program
The chemical composition of food is the most importance, from different aspects including nutrition and health, toxicology and safety, microorganisms, chemical and physical changes. The analysis of these compounds provides information on consumers for the nutrition value of food, provides quality during production and storage, and is necessary because of legal regulations.

Contents of the course program
Theoretical classes. Thematic units will include legislation for foodsampling, preparation of samples, review of methods for determining the basic ingredients, analytical procedures for determining the basic ingredients (water, solids, minerals, fats, proteins, and sugars) and writing analytical reports.
Practicals. In the practical part PhD students will have the opportunity to independently participate in the performance analysis for determination of nutrients in food and feed. The program includes: determination of fat...
infoodproducts by Soxhlet, analysis of fatty acids by gas chromatography, determination of total protein per Kjeldahl, identification and determination of amino acids, determination of mono and oligosaccharides, proving antioxidants, artificial sweeteners. Quality and safety of drinking water and importance of the water for health (determination of: pH, residual chlorine, chloride, reduction power, nitrogen compounds (ammonia, nitrite, nitrate) in water, determine the alkalinity and hardness of water).

Organization
30 hours theory classes and practicals
60 hours other forms of activity

Teaching methods
Theory classes and practicals: interactive

Purpose and objectives of the course program
With this course PhD student would get extended knowledge about the parasitic zoonoses which are transmissible from animals to humans and vice versa and their diagnostics. Also, they would be able to recognize the risks during handling with animals used in common and science researching work.

Contents of the course program

Theory classes. Giardiosis, Balantidiosis, Cryptosporidiosis, Toxoplasmosis, Leishmaniasis, Babesiosis, Neurocystisercosis, Echinococcosis, Dipylidiasis, Coenurosis, Fasciitis, ocular larva migrans and visceral larva migrans syndrome, cutaneous larva syndrome, strongyloides, anasakiasis, trichinellosis, dirofilariasis, unusual human infections caused by animal parasites, tics, insects and other ectoparasites as vectors of human parasite diseases.
Practicals. Parasitological examination of feces, blood and tissues.

**Purpose and objectives of the course program**

The aim of the course is understanding the immune and immunopathological mechanisms in parasitic infections. This knowledge will be beneficial in better understanding and performing the laboratory diagnostic procedures and in clinical practices. At the same time it will be a basic foundation for the setting up of future experiments for the development and research of the vaccines against parasites. Immunopathological mechanisms that will be part of the objectives of this course will contribute in better understanding of the selection of adequate therapy and preventive measures for the parasitic diseases.

**Contents of the course program**

**Theory classes.** Basic principles of immunoparasitology. Parasitic antigen presentation, cell mediated and humoral immunity induced with protozoan parasites and helminths. Mechanisms of parasitic invasions of the immune system (immune response to parasites). The role of the network of cytokines in protection against parasitic infections and immunopathology. Parasites and allergies. Possibilities of specific immune protection against parasitic infections (vaccines against parasitic diseases)

**Practicals.** ELISA, dot-ELISA, immunofluorescency, cytometry, real-time PCR

**Organization**

30 hours theory classes and practicals
60 hours other forms of activity

**Teaching methods**

- Theory classes and practicals: interactive
- Written assay: learning with use of referent literature and internet, making of
written assay: oral presentation and discussion of the written assay.

| Realized by | prof. Slavcho Mrenoshki, PhD  
prof. Dine Mitrov, PhD |

**Purpose and objectives of the course program**

The course includes training of the students to perform, read and interpret the results from basic and advanced serological methods used in the diagnosis of important diseases in animals, with special emphasis on diseases present in Republic of Macedonia.

**Contents of the course program**

- **Theory classes and practicals.** Diagnostic performances of serological methods and influence of the results on the programs for control and eradication of diseases.

**Organization**

- 30 hours theory classes and practicals
- 60 hours other forms of activity

**Teaching methods**

Theory classes and practicals: interactive

**Specific recommendations related with teaching**

**Scoring of the student’s activities:**

<table>
<thead>
<tr>
<th>Activity type</th>
<th>Points</th>
</tr>
</thead>
<tbody>
<tr>
<td>2 periodical evaluations during the teaching or written exam with duration of 2 hours</td>
<td>40.0</td>
</tr>
<tr>
<td>Written assay – project with oral presentation</td>
<td>40.0</td>
</tr>
<tr>
<td>Attendance and activity</td>
<td>20.0</td>
</tr>
<tr>
<td><strong>Total:</strong></td>
<td>100.0</td>
</tr>
</tbody>
</table>

**Evaluation of knowledge**

Periodical evaluations: two (written)

**Final grade mark forming criteria:**

<table>
<thead>
<tr>
<th>Points</th>
<th>Grade mark</th>
</tr>
</thead>
<tbody>
<tr>
<td>to 59</td>
<td>5 (F)</td>
</tr>
<tr>
<td>60-68</td>

| Realized by | prof. Slavcho Mrenoshki, PhD  
prof. Dine Mitrov, PhD |

**Purpose and objectives of the course program**

The course includes training of the students to perform, read and interpret the results from the molecular methods used in the diagnosis of the most important diseases in animals, with special emphasis on diseases present in Republic of Macedonia.

**Contents of the course program**

- **Theory classes and practicals.** Molecular diagnostic methods (PCR, real time-PCR). Sequencing – sequence alignment and comparison. Construction of phylogenetic trees and their interpretation. Epidemiological trace-back of the
diseases using genetic data.

**Organization**
- 30 hours theory classes and practicals
- 60 hours other forms of activity

**Teaching methods**
- Theory classes and practicals: interactive
- Written assay: learning with use of referent literature and internet, making of written assay; oral presentation and discussion of the written assay.

**Specific recommendations related with teaching**

- 2. Extracts from the referent literature
- 3. Internet

**Course**
- **Virological methods in veterinary diagnostics**
- **Code**: FVMS DS64
- **Year of study**: I
- **Semester**: winter or summer
- **Total teaching lessons**: 90
- **Realized by**: prof. Slavcho Mrenoshki, PhD

**Purpose and objectives of the course program**
The course includes advanced training for PhD students for theoretic introduction with most important viral diseases present in Republic of Macedonia, as well as an advanced practical training for their diagnostics.

**Contents of the course program**
- **Theory classes.** Introducing the most important viral diseases in Republic of Macedonia, their epidemiology, methods of prevention and control of the diseases, correct choice of material and sampling methods for virological examination, types of virological techniques for viral diseases diagnostics, detection of viral antigen, detection of viral nucleic acid, sequencing and phylogenetic methods.
- **Practicals.** Aseptic working technique, preparation of cell cultivation media, preparation of antibiologic and transport media for virological testing samples, preservation of cell cultures, trypsinisation, cell count in Neubauer chamber, passaging of confluent cells, preparation of material for virus isolation, inoculation of material in cell culture, use of embryonated eggs for isolation of viruses and chlamidiae, inoculation of material in alantois cavity, inoculation of material in yolk sack membrane, use of stains for detection of chlamidia, use of agglutination and immunofluorescence methods for detection of viruses, viral antigen detection, detection of viral DNA/RNA.

| Purpose and objectives of the course program | The course includes advanced training for PhD students for theoretic introduction with most important bacterial diseases present in Republic of Macedonia, as well as an advanced practical training for their diagnostics. |
| Contents of the course program | Theory classes would comprised two parts: general and special. General part is upgradation of knowledge from bacteriology gained on graduated studies, and this part is relatively same for all candidates. The special part would be modulated according the special needs of each candidate, i.e. studying of such species of bacterial pathogens related with the PhD study main topic of the candidate. Practical would be realized in Faculty's Laboratory for bacteriology where the candidate would be trained for use of diagnostic techniques for isolation and identification of bacterial species related with his/her PhD study main topic. |
| Organization | 30 hours theory classes and practicals 60 hours other forms of activity |
